MVNO Web Interface for Telecom Service Launch

SELF EMPLOYEE

Project Overview :

A major financial institution in Korea launched a new MVNO (Mobile Virtual Network Operator) service as part of its digital expansion.

Role: Frontend Developer

- Built key service pages using React.js
- Integrated with backend APIs and adjusted responses to match UI needs
- Collaborated with backend and planning teams to ensure smooth service launch

Key Features Implemented:

- Friend Management (Add/Delete friends for group plans)
- Friend Cancellation Workflow
- Benefits Page (Showcased event-based coupons and special offers)
- Collaborated with backend and planning teams to ensure smooth service launch

One of the MVNO Project Flow Charts (Add Friend for group)

EV Charger Management Platform Development for a Well-Known Retailer

SELF EMPLOYEE

Project Overview :

Developed and enhanced a charging station management system that optimized operator workflows and improved user experience with real-time data visualization and interactive map services.

Role: Frontend Developer

- Built key service pages using React.js, TypeScript
- Implemented UI components for management dashboards
- Maintained and optimized the charging station map using Google Maps API

Key Features Implemented:

- **Improved Operational Efficiency:** Built a dashboard that enabled real-time monitoring of charging availability and pricing, reducing manual management efforts.
- **Optimized Charger Onboarding:** Designed a charger registration system that streamlined the onboarding process, cutting down registration time significantly.
- **Enhanced User Navigation:** Maintained and improved Google Maps-based charging map, resulting in faster location search and better usability for operators and customers.

 KMS for Real-Time Customer Support

SELF EMPLOYEE

Project Overview :

Developed a Knowledge Management System (KMS) for a customer service center, enabling support agents to access and retrieve relevant information in real-time during consultations. The system improved response accuracy and speed while maintaining up-to-date knowledge resources.

Role: Frontend Developer

- Built main features using React.js + Redux for dynamic state control.
- Implemented **role-based page components** for users and admins.
- Created shared module functions and contributed to UI consistency.

Key Features Implemented:

- **Smart Search with Highlighting:** Implemented real-time search with keyword highlighting and filters, reducing response time for support agents during consultations.
- **Role-based Page Routing:** Separated user/admin views with component-level access control, improving system security and development scalability.
- **Interactive Tools & Alerts:** Developed features like a live notification popup and date/age calculator, enhancing user efficiency without relying on external tools.

Web Development for Supply Chain Management Platform

BIMATRIX

Project Overview :

Led development and enhancement of multiple supply chain systems including demand planning (DP), PSI balance management, and MPS scheduling. Projects aimed to automate planning workflows, integrate ERP data, and support data-driven decision-making.

Role: SCM Web Developer

- Handled interface and data logic between ERP and planning systems using Oracle procedures and SOAP APIs.
- Specialized in database query development and frontend dashboard design using D3.js and High charts.
- Supported both manual and batch-based operations with backend scheduling and version control.

Key Features Implemented:

- **Automated PSI Planning** using EPA (Excel Process Automation) to build a portal that streamlined monthly production quantity calculation based on sales goals and target inventory.
- **PSI Visibility Dashboard** enabling real-time comparison of 3-month actual vs planned sales and production, with allocation logic tied to inventory targets.
- **ERP–MES Integration Interface** connecting ERP master data and sales records to MES systems, enabling automated transfer of forecasted production requirements.

SCM Project

Web Development for Text Analysis System

NHNDIQUEST

Project Overview :

Developed a VOC (Voice of Customer) system to support accurate and efficient information retrieval in the customer service center. The system was built using a search engine-based solution, featuring an integrated search page and data-driven dashboards. Aimed to improve response accuracy, keyword tracking, and internal visibility of customer feedback.

Role: Search Engine based Web Developer

- Developed front-end and back-end components using Spring MVC, Bootstrap, and AJAX for search engine web systems.
- Built search APIs with advanced features like filtering, highlighting, and keyword grouping.
- Contributed to VOC data dashboard (30%) and shell scripting for automated solution installation (40%).

Key Features Implemented:

- Extracted top-ranking and issue keywords from VOC data to drive marketing insights and visualization.
- Created a unified search interface with sorting, filtering, and real-time highlighting features.
- Built project tracking tools (PMS) and automated weekly progress email system.

Thank you for your time and consideration.

I am excited to bring my experience and passion into a new challenge.
